

SURFACE SUPPLY DIVE CONTROL SYSTEM

APPLICATION: The Dive Control System is useful for lightweight, shallow surface supplied diving where, due to visibility, dive duration, or the nature of the work task, standard scuba methods are not desirable.

DESCRIPTION: This tool is a two-diver control console, which provides gas supply, depth monitoring, and voice communication for surface supply air diving. The portable design allows for use of a gas rack, "K" cylinders, or scuba cylinders as a source of gas, and one person can easily operate the system. Communications can be powered via an internal battery or an external power source. Standard umbilicals are 150' long.
